Allowable Subject Matter

1. Claims 1-12 are allowed.

Claims 1, 7, and 12 are independent claims.

The following is an examiner's statement of reasons for allowance:

As to claims 1, and 7, the present invention from the current application discloses an image forming apparatus or system comprising: “the image forming control unit discriminates defective conveyance of the recording paper on the basis the information regarding the presence or absence of the recording paper which is outputted from the detecting unit, discriminates which of a plurality of types of defective conveyance the defective conveyance is, and transmits information regarding the defective conveyance to said image processing control unit, and when the information regarding said defective conveyance which is received from said image forming control unit is information showing the occurrence of specific defective conveyance, the image processing control unit transmits a defective conveyance cancelling signal to cancel the specific defective conveyance to the image forming control unit”.

As to claim 12, the present invention from the current application discloses a controller of an image forming apparatus comprises: “a generating unit for generating a cancelling signal for cancelling the specific defective conveyance when the input signal to cancel the defective conveyance is inputted by the input unit and when the discriminating unit determines the occurrence of the specific type of defective conveyance”.

The closest prior art such as Ohkawa (U.S. Patent No. 6,101,935), which is recorded on the Examiner's Citation of Pertinent Prior Art below, discloses if the conveyance is defective, then a pressure cancelling mechanism, not shown, cancels the pressure in order to prevent the

Art Unit: 2625

press drum 10 from contacting the ink drum; and Yoshie et al. (US Patent No. 6,575,447 B2), which is recorded on the Examiner's Citation of Pertinent Prior Art below, discloses arranging a driving means of the pressing means below the booklet conveyance path and by swinging the pressing means to make it to be opened and closed in the cutter for cutting, after a swelling in the vicinity of a folded portion of the booklet subjected to center-stapling processing and center-folding processing is pressed by a pressing means to be removed and flattened, it is possible to make the space above the booklet conveyance path to be opened broadly so that the booklet in the defective conveyance may be taken out easily and safely.

However, from the prior art above, either separately or in combination, including an updated electronic text search, fails to anticipate or render the above underlined limitations obvious.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Citation of Pertinent Prior Art

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure:

Orii (US Patent No. 4,414,887) discloses each auxiliary control unit includes a shift register for setting input data in response to a shift signal from the main control unit, a circuit for

Art Unit: 2625

receiving a workpiece conveyance signal from the main control unit when the output of the shift register is raised to "1", a circuit for receiving a press operation signal from the main control unit when the shift register provides the output "1", and a shift register clear circuit for clearing the output "1" of the shift register, so that the presses are started successively at the start of the line operation and stopped successively at the end of the line operation, and when a defective workpiece is removed from a press during the line operation, the following presses are stopped one after another.

Ohkawa (U.S. Patent No. 6,101,935) discloses if the conveyance is defective, then a pressure cancelling mechanism, not shown, cancels the pressure in order to prevent the press drum 10 from contacting the ink drum.

Yoshie et al. (US Patent No. 6,575,447 B2) discloses arranging a driving means of the pressing means below the booklet conveyance path and by swinging the pressing means to make it to be opened and closed in the cutter for cutting, after a swelling in the vicinity of a folded portion of the booklet subjected to center-stapling processing and center-folding processing is pressed by a pressing means to be removed and flattened, it is possible to make the space above the booklet conveyance path to be opened broadly so that the booklet in the defective conveyance may be taken out easily and safely.
